

STRICTLY PRIVATE & CONFIDENTIAL

Confidential Information Memorandum

An answer-engine optimization platform.

A built, deployed AEO analytics platform — offered for acquisition as an asset and a head start in one of software's fastest-emerging categories.

Prepared: August 2026 · **Domain:** useanswr.com · **Stack:** Next.js 16 · React 19 · TypeScript

This memorandum is confidential and intended only for the recipient. See the confidentiality notice within.

1. Confidentiality notice & disclaimer

This Confidential Information Memorandum (the "Memorandum") has been prepared by the owner of Answr (the "Seller") solely to assist the recipient in evaluating a possible acquisition of the Answr platform and related assets (the "Business"). It is provided on a strictly confidential basis. By accepting it, the recipient agrees to keep its contents confidential, to use it only to evaluate the potential transaction, and to return or destroy it on request.

This Memorandum does not constitute an offer to sell or a solicitation of an offer to buy, and does not form the basis of any contract. The information reflects the Seller's good-faith description of the Business as of the preparation date; it has not been independently audited. **The dashboard figures, metrics, and any data shown in the product are illustrative demonstration data on a curated sample workspace — they are not indicative of any actual usage, traffic, customers, or revenue, of which there are none.** Statements about markets, categories, timelines, costs, pricing, and potential are illustrative and forward-looking, and actual results may differ materially.

The Seller makes no representation or warranty, express or implied, as to the accuracy or completeness of the information, which will be superseded by the representations in any definitive purchase agreement. Each recipient should conduct its own independent investigation and rely on its own advisors. Nothing herein is legal, financial, tax, or investment advice.

2. Executive summary

Answr is a complete, deployed platform for **Answer Engine Optimization (AEO)** — the emerging discipline of measuring and improving how a brand appears in AI-assistant answers. It is offered for acquisition as an asset: the product, brand, and domain are built and live; a new owner supplies API keys and a storage credential, completes a short remaining build, and takes it to market.

Live deployed on Vercel at useanswr.com	Real first-party AI-crawler pipeline works today	Engine auth, scoring, integrations — built	Asset pre-revenue; offered on an asset basis
--	---	---	---

Buyers increasingly ask ChatGPT, Claude, Gemini, Perplexity, and Google's AI Overviews instead of clicking search results, and brands have little visibility into what those assistants say about them or which sources they cite. Answr addresses exactly this: it monitors AI answers, traces their citations, tracks AI crawlers hitting a brand's site, and turns gaps into a prioritized action queue.

What is real, what is demonstration, and what remains — at a glance

The single most important thing for a buyer to understand. Stated plainly and cross-referenced throughout:

Status	What it covers
Real now	The marketing site and dashboard experience; the export/reporting and filtering engines; and — most notably — the first-party AI-crawler telemetry pipeline, which genuinely captures AI bots on the deployment it runs on.
Demo data	Most dashboard analytics run on a curated sample ("Nike") workspace so the full product is demonstrable. The mechanisms are real; the numbers are illustrative until real data flows in.
Activates with keys	The provider integrations, durable storage, and nightly sampler are written and wired; they turn on when the buyer adds API keys and a storage credential.
Requires a short build	Two value steps are engineering, not configuration: feeding the scoring engine's output into the dashboards (so numbers become real per customer), and multi-tenant isolation for serving many customers.

The Business is offered as an **asset sale** — the fastest, lowest-risk way for an operator to enter the AEO category with months of engineering, design, and category work already completed. Offers are invited (see §13).

3. Acquisition highlights

- 1 A working first-party data pipeline.** The AI-crawler telemetry capture — detecting bots that never execute JavaScript — is genuinely built and functioning on the deployment. This is the technically hardest, most defensible primitive in the category, and it exists today (as working plumbing; it is not yet a dataset of accumulated traffic).
- 2 A real backend engine, built to activate.** Persistence, script authentication, an answer-scoring engine with documented formulas, and hand-written provider integration clients — written and wired, turning on with credentials rather than needing to be created.
- 3 A complete, polished product surface.** A full marketing site, a 36-screen analytics dashboard, and account/onboarding flows — type-clean and building cleanly, with an unusually disciplined "honesty layer" that labels demonstration-only controls.
- 4 A clean, brandable, self-contained asset.** The useanswr.com domain, a complete visual identity and design system, and original content built on permissively licensed open-source (evidence for diligence in the data room).
- 5 A timely category and a build-vs-buy shortcut.** AEO / GEO is early and funded (peers have raised capital), validating the market; this asset lets an operator enter it with a deployed platform rather than a multi-month build.

4. Rationale for sale

Answr was built to the point of a complete, deployed, demonstrable platform. Taking it from here to a live, growing business is primarily a go-to-market and operating job — a different undertaking, and a different skill set, than building it. The Seller is offering the Business so that an operator better positioned to launch and grow it can do so, rather than have a finished platform sit idle.

5. The opportunity

A growing share of product research, comparison, and recommendation now happens inside AI assistants rather than a traditional results page. When a buyer asks an assistant to "recommend a tool like X" or "compare the best options," it returns a synthesized answer and cites a handful of sources — and most brands cannot see whether they appear, how they are described, or which sources shape the answer.

Answer Engine Optimization (AEO) — also called Generative Engine Optimization (GEO) — is the emerging practice of measuring and improving that presence. It is to AI assistants what SEO was to search engines, and it is early: the tooling category is nascent, and search-visibility budgets are beginning to move toward AI-answer visibility.

Why now. The measurement problem is real, unsolved for most brands, and growing with AI-assistant usage. A platform that already measures AI-answer visibility, citations, and crawler activity is positioned for exactly this shift.

Market characterizations here are qualitative and illustrative; no specific market-size figures are asserted. A buyer should form its own view of category size and timing.

6. Product overview

Answr spans four capabilities a brand needs to manage its presence in AI answers:

Capability	What it does
Answer Engine Insights	Measures visibility and share of voice across ChatGPT, Claude, Gemini, Perplexity, and AI Overviews — by topic, platform, region, and audience.
Citations	Traces the sources behind AI answers — which domains and pages get cited, owned vs. earned, and what's newly cited.
Agent Analytics	Tracks AI crawlers hitting the brand's site (first-party capture), plus AI-referred visits.
Actions & Workflows	Turns visibility gaps into a prioritized, impact-scored action queue, with reporting and exports.

Delivered through a marketing site (31 pages), a 36-screen analytics dashboard, and account/ onboarding flows, backed by a documented metric model. A full feature inventory is in the data room.

7. Technology & intellectual property

Next.js 16, React 19, TypeScript, deployed on Vercel with GitHub auto-deploy. Type-clean and building cleanly, with a deliberately small dependency footprint. Accurate technical description of the engine:

- **Persistence** — a backend-agnostic data layer running in-memory today; the implemented durable backend is **Redis/KV** (Upstash / Vercel), which activates with a credential. A Postgres backend is a straightforward adapter against the same interface, and is not yet implemented.
- **Authentication** — a bespoke account system (bcrypt password hashing, sessions). It is built and functional but has **no automated test coverage and no independent security review**; hardening (rate limiting, lockout, CSRF, session hardening) remains.
- **Scoring** — real functions that turn sampled AI answers into the platform's metrics using a documented formula set.
- **Provider integrations** — hand-written clients for Perplexity, OpenAI, Anthropic, Gemini, and DataForSEO, written to each provider's documented API but **not yet run against live endpoints**; verify with live keys during diligence.
- **Telemetry** — the genuinely functional first-party AI-crawler and referral capture; per-customer deployment uses a proxy/snippet install.

There is **no automated test suite yet** — verification to date is type-checking, clean builds, and manual/functional checks. The acquisition transfers full ownership of the original source, the Answr brand and `useanswr.com` domain, the design system and design canvases, all original content and the metric model, the demo dataset, and the documentation set (schedule in §13/§14).

8. Current status & what's built

The platform is deployed and operable as a demonstration. Restating the four-way status from §2 with the honest boundary between configuration and remaining engineering:

- **Real now** Marketing site, dashboard experience, export/reporting and filtering engines, and the first-party telemetry pipeline.
- **Demo data** Most dashboard analytics run on a curated sample workspace; real mechanisms, illustrative numbers.
- **Activates with keys** Provider connectivity, durable storage, and the nightly sampler — configuration.
- **Requires a short build** Wiring scored output into the dashboards, and multi-tenant isolation — engineering, not configuration. The current build is effectively single-workspace.

Pre-revenue and pre-launch. There are no customers or revenue today, and no customer data or associated liability. The value is the built asset and the time-to-market it buys. The buyer's remaining work is activation plus the short build above — detailed in the launch roadmap in the data room — not a rebuild.

9. Business model

Answr is designed as a subscription SaaS with tiered pricing already built into the product:

Tier	Positioning
Growth	Entry tier for a single brand — core visibility, citations, and actions.
Scale	The primary tier — more prompts, platforms, workflows, and API/MCP access.
Enterprise	Multi-brand, SSO/SAML, data residency, white-label, priority support (designed; not yet built).

The model is recurring, with a designed agency/reseller motion (pooled quota, white-label reporting) for higher-leverage distribution. **Pricing is an intended framework, not validated economics.** Cost of goods is primarily usage-based provider-API spend that scales with how many prompts × platforms are sampled per customer; a buyer should model per-customer API and infrastructure cost against these tiers to assess gross margin. The Business is **pre-revenue**.

10. Competitive landscape

The AEO/GEO category is young and active. Dedicated entrants include **Profound** and **Peec AI**, with others (e.g. Otterly, Goodie, Scrunch/Athena-class tools) emerging. Two structural threats a buyer should weigh: **SEO incumbents** (e.g. Semrush, Ahrefs) adding AEO features to large existing user bases, and the **AI providers themselves** potentially surfacing native analytics.

That several players have raised capital is itself category validation. Answer's position is a **build-vs-buy shortcut**: a deployed, full-stack platform (visibility, citations, first-party crawler analytics, and an action layer) with the hardest primitive — first-party capture — already working. A buyer should assess where Answer is at parity or behind funded competitors, not only where it may have an edge.

11. Growth & upside

Qualitative expansion vectors the built engine already supports (illustrative optionality, not projections or commitments):

- **Category tailwind** — value grows with AI-assistant adoption and the budget shift toward AI-answer visibility.
- **Channel leverage** — the built-in agency/reseller model can extend reach across many end brands through one relationship.
- **Product expansion** — additional platforms, deeper citation and sentiment analysis, and a licensed conversation-data panel are natural extensions of the existing architecture.
- **Enterprise segment** — the enterprise feature set is designed and can be built out to open a higher-value tier as the product matures.

12. Key considerations

Stated plainly, because the asset's credibility rests on candor. A buyer should weigh:

Consideration	Detail
Pre-revenue, unproven demand	No customers or revenue; market demand and pricing are unvalidated.
Remaining work to launch	Activation (keys, storage) plus a short build (scoring→dashboards, multi-tenant) before it serves paying customers.
Third-party provider dependency	Core measurement depends on external LLM/SERP providers whose pricing, limits, availability, and terms can change; querying AI Overviews via SERP data is an industry-standard but ToS-sensitive area. Provider clients need live verification.
Untested at volume	The full system has not run end-to-end at production volume; integration behavior and auth hardening are unexercised.
Single-tenant today	Multi-customer isolation, per-customer key management, SSO/SAML, and residency remain to be built.
Founder-transfer risk	Solo-built; mitigated by an extensive documentation set and an offered handover (§13).
Competitive risk	Funded specialists and SEO incumbents are active in the category.

13. The transaction

Structure & assets included

Offered as an **asset sale**. The transaction conveys:

- The complete source code and repository, with full ownership and rights.
- The `useanswr.com` domain and the Answr brand, name, logo, and visual identity.
- The design system and original design canvases; all original content and the 31-metric model.
- The first-party telemetry pipeline and the demo dataset.
- The full documentation set (feature inventory, technical documentation, launch roadmap, activation guide, assets/IP schedule).

Excluded / buyer-provided: the Seller's own third-party accounts and API keys, and any real customer data (none exists). A detailed assets/IP schedule is in the data room.

Value basis

As a pre-revenue asset, the Business is offered on an **asset basis** (not an earnings multiple), and **offers are invited**. Rational value frames are replacement cost — the engineering, design, and category work embodied

in a deployed platform with a working first-party pipeline — and strategic/option value to an operator already positioned in or adjacent to the category. Value drivers: build completeness, the working pipeline, the brand and clean-IP domain, and category timing.

Transition & support

The Seller can provide a defined post-close **handover** to help a buyer stand the platform up — activation and runbook support to connect keys and storage, a walkthrough of the architecture and data model, and a support window (scope and duration by agreement). A structured transition plan accompanies this Memorandum.

Process

Interested parties are invited to (1) review this Memorandum and the data-room materials; (2) evaluate the live product via a guided walkthrough and, on request, a keyed diligence instance; (3) conduct technical diligence against the repository and documentation; and (4) submit an indicative offer (range, structure, and any contingencies). A submission timeline and preferred point of contact are available from the Seller on request.

14. Data room & diligence index

The following accompany this Memorandum and are available to qualified parties:

Platform feature inventory — every feature, with technical depth	PLATFORM_OVERVIEW
Technical documentation — architecture, engine, APIs, deploy	TECHNICAL DOC (PDF)
Launch roadmap — what remains to activate and launch	LAUNCH_ROADMAP
Assets & IP schedule — everything transferring, with encumbrances	ASSETS & IP
Activation guide — step-by-step to turn the platform on	HANDOFF
Transition / handover plan	HANDOVER PLAN
Integration & metric references	INTEGRATIONS · METRICS

Recommended additional diligence artifacts (to be provided/confirmed): repository access; a dependency license report (SBOM) evidencing no copyleft/commercial-license conflicts; confirmation of sole authorship and IP assignment, including AI-assisted code provenance; trademark and domain clearance for the "Answr" name; and a reproducible clean-build log.

Contact. Enquiries and offers regarding this opportunity should be directed to the Seller. This Memorandum is confidential and provided subject to the notice in §1.
